-!-FUNCTION: The UVTABC repair system catalyzes the recognition and
processing of DNA lesions. UvrC both incises the 5' and 3' sides
of the lesion. The N-terminal half is responsible for the 3'
incision and the C-terminal half is responsible for the 5'
incision (By similarity).

-!- SUBUNIT: Interacts with uvrB in an incision complex (By

"Primary structure of the major allergen of yellow mustard (Sinapis alba L.) seed, Sin a I.";
Eur. J. Biochem. 177:159-166(1988).
-!- FUNCTION: This is a 25 seed storage protein.
-!- SUBGUIT: The protein consists of two chains linked by disulfide bonds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- ALLERGEN: Causes an allergic reaction in human. -!- SUBUNIT: The mature protein consists of a small and a large chain linked by disulfide bonds.
-!- TISSUE SPECIFICITY: Cotyledons and the axis.
-!- SIMILARITY: Belongs to the 2S seed storage albumins family.

SIGNAL-ANCHOR (TYPE-II MEMBRANE PROTEIN)
                                                                                                                                                                                                                                                                                                                                                                             -i. FUNCTION: Plays a role as a receptor for the recognition of MHC class I HLA-E molecules by NK cells and some cytotoxic T-cells.
-i. SUBUNIT: Can form disulfide-bonded heterodimer with CD94.
-i. SUBCELLULAR LOCATION: Type II membrane protein.
-i. TISSUB SPECIFICITY: Natural killer cells.
-i. SIMILARITY: Contains 1 C-type lectin family domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EXTRACELLULAR (POTENTIAL).

Biol. 26:1711-1723(1994).
-!- FUNCTION: The small, basic, water-soluble napins are one of the two major kinds of storage proteins synthesized in the seed during its maturation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -!- SUBDINITY: The mature protein consists of a small and a large chain linked by disulfide bonds.
-!- TISSUE SPECIFICITY: Cotyledons and the axis.
-!- SIMILARITY: Belongs to the 2S seed storage albumins family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Boutilier K.A., Gines M.J., Demoor J.M., Huang B.,

                                    diphosphate + L-arginyl-tRNA(Arg).
-!- SUBUNIT: Monomer; also part of a multisubunit complex that groups tRNA ligases for Arg, Asp, Glu, Gln, Ile, Leu, Lys, Met and Pro.-:- SUBCELLUMAR LOCATION: Cytcoplasmic.
-!- DOMAIN: The N-terminal (AA 1-72) has two regions predicted to be alpha-helical that might be involved in the multisynthetase
                                                                                                                                                                                                                                            -:- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;
                  CATALYTIC ACTIVITY: ATP + L-arginine + tRNA(Arg) = AMP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DB 1; Length 660;

-! FUNCTION: Receptor for prostacyclin (prostaglandin I2 or PGI2).
-The activity of this receptor is mediated by G(s) proteins which activitae adenylate cyclase.
-! SUBCELLULAR LOCATION: Integral membrane protein.
-: SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nakagawa O., Tanaka I., Usui T., Harada M., Sasaki Y., Itoh H., Yoshimasa T., Namba T., Narumiya S., Nakao K.; "Molecular cloning of human prostacyclin receptor cDNA and its gene expression in the cardiovascular system."; Circulation 90:1643-1647(1994).

1. Biol. Chem. 277:15237-15240(2002).

2. -!- FUNCTION: Probable regulator of CDKS activity. May inhibit CDKS cluncion via its interaction with CDKSR1.

2. -!- SUBDNIT: Interacts with CDKSR1 and CDKSR2.

2. -!- SUBDNIT: Interacts with CDKSR1 and CDKSR2. The interaction with CDKSR1 is prevented by the association between CDKSR1 and CDKSRAP2. Interacts also with the complex CDKSR1-CDKS. Does not interact with monomeric CDKS. The interaction is prevented by the association between CDKSR1 and CDKSRAP2.

2. -- DOMAIN: The C-terminal part (475-586) is necessary for the interaction with CDKSRAP1, while the N-terminal part (1-168) is required for inhibiting the activity of the CDKS kinase.

2. -- SIMILARITY: Belongs to the UPP0004 family. CDKSRAP1 subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides and a cyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

To cyclisation are used to interfere with angiogenesis.

To cyclisation are used to interfere with angiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, corpuraterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced meovascularisation of the liver, excessive cramma, substance-induced meovascularisation of the liver, excessive cramma, propertension induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver sequelae, hypertension induced neovascular excessive corputation. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accountation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to inage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere continuation in the peptides are used to condition with at least one biological activity induced by VEGF. VEGF-C or -D and care also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy

Human and mouse type C lectin(s) - useful as competitive inhibitor of lectin activity and as molecular markers for tissues that express them

Example; Fig 3; 72pp; English.

The present invention describes an isolated type C lectin polypeptide (I) comprising amino acid residues 37-133, 37-174, 175-229, 234-360, 381-507, 520-645, 657-809, 884-951, 970-1108, 1110-1243, or 1259-1393 of the protein sequence given in AAB23822. The first 2 polypeptides are capable of binding to a carbohydrate residue, and the rest of the polypeptides

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused in P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the are useful for producing antibodies capable of binding to these 2 polypeptides. Polynucleotide sequence encoding the polypeptides of the invention are useful in the identification and purification of their native ligands, and as molecular markers of the tissues in which they are expressed. They provide valuable sequence motifs, which can be inserted or substituted into other native members of the endocytic type C lectins, and provide hybridisation probes for searching cDNA and genomic libraries for the coding sequence of other type C lectins. Variants of type C lectins may be used therapeutically as competitive inhibitors of the biological activity of native type C lectins. The present sequence represents a murine phospholipase A2 receptor protein which is homologous to a type C lectin ó SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant. ```
presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosobbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                       Propionibacterium acnes predicted ORF-encoded polypeptide #24882.

New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. Example 1; SEQ ID NO 24882; 1481pp; English.

The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to additionally encompasses expression vectors and host cells comprising a polynucleotide of the invention, antibodies against polypeptides of the invention, polynucleotide of the invention; an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, a vaccine composition (comprising P. acnes polypeptides, antibodies, fusion proteins, T cell populations, or

```
antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a patient; and amethod for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the Colypeptides are useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein. The polynucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acne, and the kit is useful for performing a diagnostic assay. The present cand the kit is useful for performing a diagnostic assay. The present cading frame) contained within the P. acnes polynucleotides of the cinvention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences

2001-616774/71. N-PSDB; AAS59559 Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.

Example 1; SEQ ID NO 14472; 1069pp; English.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne,

pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies of specific for P. acnes proteins. These antibodies can be used to down-equilate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by charge linked immunosorbent assay (BLISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format directly from WIPO at the vipo.int/pub/published_pot_sequences Score 39; DB 4; Length 88; Pred. WPI; 2003-381789/36. N-PSDB; ACF64488. New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.

Example 1; SEQ ID NO 14472; 1481pp; English.

The invention relates to an isolated polymucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polymucleotide of the invention, antibodies against polypeptides of the invention; invention; fusion proteins comprising a polypeptide of the invention; a

method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared to polypeptide and an isolated T cell population cells a cones polypeptides, via this method; a vaccine composition (comprising P. acnes polypeptides, or polymucleotides); a method and kit antigen-presenting cells that express the polypeptide); a method and kit cantigen-presenting or determining the presence or absence of P. acnes in a patient; and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the proteins, or for stimulating an immune response specific for a P. acnes polypeptides are useful for diagnosing, preventing or treating acnes to protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acnes, and the kit is useful for performing a diagnostic assay. The present cand the kit is useful for performing a diagnostic assay. The present canding frame) contained within the P. acnes polymucleotides of the reading crame) contained within the P. acnes polymucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly the printed specification, but was obtained in electronic format directly contained within the P. acnes polymetices.

```
AAF81714 to AAF81740 encode the human proteases and protease inhibitors (PPIMs) given in AAB74668 to AAB74664. The PPIMs can have activities such as: anti-human immunodeficiency virus (HIV); antidiabetic; antithyroid; immunostimulant; immunomodulator; antidiamatory; immunosuppressive; imphrotropic, antigout; thyromimetic; cytostatic; antibacterial; fungicide; protozoacide; antiatreriosclerotic; antiatherosclerotic; virucide; antipsoriatic; and hepatotropic. PPIM polynucleotide and protein sequences can be used in the diagnosis, treatment and prevention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; protease; protease inhibitor; protease and protease inhibitor; pppM; identification; diagnosis; anti-human immunodeficiency virus; HIV; antidabetic; immunostimulant; immunomodulator; antiinflammatory; antithyroid; immunosuppressive; nephrotropic; antiinflammatory cytostatic; antibacterial; fundicide; protozoacide; antiarteriosclerotic; antiatherosclerotic; antipsoriatic; virucide; hepstotropic; gene therapy; autoimmune disorder; inflammatory disorder; AIDS; DiGeorge's syndrome; severe combined immunodeficiency disease; SCID; Chediak-Higashl syndrome; Crohn's disease; Addison's disease; autoimmune thyroiditis; gout; Crohn's disease; Mabhimoto's thyroiditis; Good pasture's syndrome; infection; Grave's diseases; Hashimoto's thyroiditis; Sjogren's syndrome; cancer; Werner's syndrome; cell proliferative disorder; arteriosclerosis; atherosclerosis;

AAD05579-AAD05658 represent cDNAs corresponding to 28 human secreted protein genes and AE01770-AAB01849 represent the proteins they encode. C AAD01850-AAB01860 represent human secreted protein fragments or variants. The genes and their secreted protein are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. The genes and their secreted protein for gene therapy. The genes and their secreted protein or gene therapy. The protein in a sample or by determining the presence of mutations in new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 28 genes, consect on the tissues in which they are most highly expressed, and include disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune of disorders, schizophrenia, asthma, skin disorders (e.g., rheumatoid attricis), inflammation, allergies, autoimmune cognitive disorders, schizophrenia, asthma, skin disorders, and includers, schizophrenia, asthma, skin disorders, cognitive disorders, schizophrenia, asthma, skin disorders, professed, and incleased proteins can also be used to aid wound healing and epithelial cell proliferation, for prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, compressive, and in chemotexis, and can be used as a food additive or partners, and in chemotexis, and can be used in alleviating symptoms associated protein of the invention can be used in alleviating symptoms associated radioimmunoassay or enzyme linked immunosorbent assay [ELISA). The reacont seminar animars a human servered enroper enzyme servered enroper enzyme servered enroper enzyments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present sequence represents a human secreted protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Albumin fusion protein; therapeutic protein X; human albumin; HA; human serum albumin; HSA; cancer; reproductive disorder; disertive disorder; immune disorder; endocrine disorder; disorder; neural disorder; connective disorder; cytostatic; antiinfertility; antiinfammatory; antiulcer; immunomodulator; anti-HIV; antidiabetic; haemostatic; noctropic; neuroprotective; antiparkinsonian; antimicrobial; neuroleptic; osteopathic; antiatripritic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 38; DB 4; Length 802;

of autoimmune/inflammatory disorders such as AIDS, DiGeorge's syndrome, severe combined immunodeficiency disease (SCID), Chediak-Higashi syndrome, Cushing's disease, Addison's disease, autoimmune thyroiditis, Crohn's disease, diabetes mellitus, Good parture's syndrome, gout, Grave's disease, Hashimoto's thyroiditis, Sjogren's syndrome, Werner's syndrome, viral, bacterial, fungal, parasitic, protozoal, and helminthic syndrome and cell proliferative disorder such as arteriosclerosis, polymucleotide sequences can be used in somatic or germline gene therapy and in diagnosis of diseases. They can also be used in generating sequences and in molecular biology techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; secreted protein; proliferative disorder; cancer; tumour; cheatal abnormality; developmental abnormality; haematopoietic disorder; immune system disorder; AlDS; autoimmune disease; rheumatoid arthritis; inflammation; allergy; neurological disorder; Alzheimer* s disease; Parkinson's disease; cognitive disorder; schizophrenia; asthma; skin disorder; psoriasis; sepsis; diabetes; atherosclerosis; cardiovascular disorder; angiogenic disorder; didney disorder; gastrointestinal disorder; angiogenic disorder; didney disorder; endocrine disorder; infection; wound healing; vulnerary; cell culture; chemotaxis; food additive; chromosome 17; binding partner identification.

The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, disestive disorders (e.g. crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), haematopoietic disorders, neural disorders (e.g. Alzheimer's, parkinson's, Creutzfeldt-Jacob disorders (e.g. Alzheimer's, meningitis, achizophrenia), and comnective disorders (e.g. osteoporosis, arthritis). ABG63326-ABG65518 represent albumin fusion proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunosuppressive; antiinflammatory; antiasthmatic; antiallergic; cytostatic; cerebroprotective; neuroprotective; nootropic; cardiovascular; antiatreriosalerotic; gene therapy; human secreted protein; immune disorder; inflammation; respiratory disorder; cancer; CNS disorder; neurodegenerative disorders; inflammatory bowel disease; nephritis; Crohn's disease, asthma; allergy; multiple sclerosis; ischaemic brain injury; Parkinson's disease; Alzheimer's disease, atheroaclerosis; myocarditis; chromosome mapping; triple helix formation; antisense gene therapy; forensic biology.
                                                                                                                       New fusion protein for treating disease e.g. diabetes comprises an albumin fused to a therapeutic protein.

The invention relates to 592 new human secreted polypeptides useful for diagnosing, treating or preventing e.g. immune disorders, inflammatory conditions, respiratory disorders, cancers, CNS disorders, an included energiative disorders, or polypeptides comprising an amino acid sequence at least 95% identical to the new sequences. The polypeptides, antibodies or antibody fragments that bind to the polypeptides, antibodies or antibody fragments that bind to the polypeptides, antibodies or antibodies, agonists or antagonists that binds to acids encoding the polypeptides, agonists or antagonists that binds to the polypeptide, are useful in preparing diagnostic or pharmaceutical compositions for diagnosing, treating or preventing an e.g. immune compositions for disease), respiratory disorders (e.g. aethma and allergy), cancers (e.g. gastric, ovarian or lung cancer). CNS disorders (e.g. multiple sclerosis or ischaemic Drain injury), neurodegenerative disorders (e.g. parkinson's disease or Alzheimer's disease), and cardiovascular disorders (e.g. atherosclerosis or myocardiits). The cardiovascular disorders (e.g. atherosclerosis or myocardiits). The cardiovascular disorders (e.g. atherosclerosis or myocardiits). The cardiovascular disorders in formation through triple helix formation or antisense DNA or RNA, in gene therapy, for identifying individuals or antisense DNA or RNA, in gene therapy, for identifying individuals or antisense DNA or RNA, in gene therapy, for identifying individuals or proventing neural disorders, information was obtened or reating or preventing neural disorders, infune system disorders, and for treating or preventing neural disorders, incomes sequence corresponds connection of the polypeptide of the invention. Note: The sequence data for this patent did form part of the princed specification, but was obtained in electronic format directly from WIPO at the sequence of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 wound healing; cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; heparotropic; antidiabetic; antiinflammatory; vulnerary; cardiant; gene therapy.

The invention relates to novel genes ADA3629-ADA40565 and proteins ADA40566-ADA41501 for human secreted proteins, useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene treating or ameliorating medical conditions e.g. by protein or gene fragments, and agonists or antagonists that bind to the polypeptide are diagnostic or preparing a diagnostic or parmaceutical composition for or core treating cancer or other hyperproliferative disorder. The polypeptides and mucleic acid molecules are also useful for detecting, preparing cancer or other hyperproliferative disorders including neoplasms, autoimmune crown them hyperproliferative disorders including neoplasms, autoimmune crown them hyperproliferative disorders (e.g. diabetes, rheumatoid arthritis, systemic lupus canaemia, haematopoietic or haematological disorders (e.g. anaemia, chaematopoietic or haematological disorders (e.g. anaemia, chaematopoietic or haematological disorders (e.g. anaemia, chaematopoietic or parting asthma or eczema, chiflammatory disorders (e.g. ischaemia-reperfusion injury, inflammatory cromporticins adisease), neurodegenerative disorders (e.g. theprendition) and injury, inflammatory disorders of epithelial cell proliferation, radiation hybrid mapping or long-correct of the chromosome identification, radiation hybrid mapping or long-correct or providing immunological probes for differential identification tangent for chromosome immunological probes for differential identification the printed specification but was for correct this patent dinort format directly from MIPO at the printed specification, but was correctly obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                New human secreted proteins and nucleic acid molecules, useful for preparing a diagnostic or pharmaceutical composition for diagnosing, preventing or treating cancer or other hyperproliferative disorder, asthma, allergies or AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; SEQ ID NO 1077; 3205pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      obtained in electronic format directly fi

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
